Environmental Radiation Effects on Mammals

Olga A. Smirnova 2016-10-14 Dr. Smirnova's updated text is devoted to the theoretical studies of radiation effects on mammals. It summarizes 35 years of results the author obtained from analyzing dose rate equivalents for the Galactic

Cosmic Rays (GCR) and for Solar Particles Events (SPE). This edition also includes two new chapters on skin epidermal epithelium and risk assessment for myeloid leukemia, as well as extended revisions addressing the radiation effects on the blood-forming system.

Mathematical models are used to explain the effects of both acute and chronic irradiation on the dynamics of vital body systems, like the hematopoietic system, the development of autoimmune diseases, and the mortality dynamics in homogeneous and nonhomogeneous mammalian populations. The proposed methodology of these studies, the models themselves, and the obtained results are of a great theoretical significance and can find wide practical use.

Isolation and Characterization of Uncle Fester, an Allorecognition Molecule in the Primitive Chordate, Botryllus Schlosseri

2011 The ability to molecularly distinguish self from non-self is a common feature throughout the metazoa and is the fundamental basis of immune function. Although this phenomenon is pervasive throughout the animal kingdom, we often find examples of highly polymorphic, naturally occurring allorecognition systems within the colonial marine invertebrates. These types of animals, specifically the sponges, hydroids, anemones, bryozoans and ascidians, are permanently attached to the substratum and typically propagate continuously via asexual reproduction, which often results in physical contact between adjacent colonies. If the colonies are compatible they will often blend together, and depending on the species will form a single chimeric individual or they will reject, during which the interacting tissues are

destroyed. In the vertebrates, histocompatibility is ultimately an artifact of medical intervention, considering that vertebrates are only naturally challenged to immunologically tolerate individuals of their own species during pregnancy. Ultimately, allorecognition in the vertebrates is controlled by polymorphisms at the MHC, which are recognized by effector cells in both the adaptive (T-cells) and innate (Natural Killer cells) branches of the immune system. Interestingly, the molecular components responsible for driving adaptive immunity within the vertebrates are entirely absent within the lower taxa. Thus, while it is clear that highly polymorphic allorecognition systems have an early phylogenetic origin, the molecular and cellular basis driving their specificity, and their relationship to the more sophisticated vertebrate immune system has remained elusive. The primary focus of my dissertation has been to characterize a candidate allorecognition protein, called *uncle fester*, and determine if it plays a

role in a naturally occurring transplantation reaction that occurs in the primitive chordate *Botryllus schlosseri*. As the closest living invertebrate relative to the vertebrates, *B. schlosseri* occupies a key position within chordate lineage and is thus phylogenetically poised to address questions regarding the origins of vertebrate innate and adaptive immunity. In chapter 2, I provide an in-depth review of the allorecognition phenotype found within Botryllids, as well as a summary of the previously characterized molecular components implicated in the response. Briefly, as colonies of *Botryllus schlosseri* grow within their natural habitat, they often come into contact with one another at extracorporeal vascular structures called ampullae. After this initial interaction, colonies will either fuse, forming a parabiotic pair and hematopoietic chimera, or they will reject, initiating a blood-based inflammatory reaction that causes the two colonies to retreat. Fusion or rejection is controlled by the

polymorphisms of a single locus, called the *fuhc*, and in order for two colonies to fuse they must share one or both alleles at this gene. In addition to the self-ligand, a putative receptor called *fester* has also been identified. Functional assays indicate that *fester* is playing dual roles in the allorecognition response, both as an inhibitory receptor involved in discriminating between different *fuhc* alleles and as an activating receptor, responsible for the initiation of both fusion and rejection. Encoded between the *fuhc* and *fester*, is a distantly related member of the *fester* family, a gene which we called *uncle fester* and its description is found within chapter 3. To characterize this locus, I posed the following questions: 1) Is *uncle fester* polymorphic at the nucleotide or amino acid level? 2) Are there alternative splice forms? 3) Where are *uncle fester* mRNA and protein expressed in juveniles and adults? and 4) What is its function *in vivo*? What I discovered is that the *uncle fester* gene consists of 9 exons

spanning a genomic region of ca. 46 Kb., contains a signal sequence, an extracellular SCR domain, three contiguous

Why Zebras Don't Get Ulcers Robert M. Sapolsky 2004-09-15 Renowned primatologist Robert Sapolsky offers a completely revised and updated edition of his most popular work, with over 225,000 copies in print Now in a third edition, Robert M. Sapolsky's acclaimed and successful *Why Zebras Don't Get Ulcers* features new chapters on how stress affects sleep and addiction, as well as new insights into anxiety and personality disorder and the impact of spirituality on managing stress. As Sapolsky explains, most of us do not lie awake at night worrying about whether we have leprosy or malaria. Instead, the diseases we fear-and the ones that plague us now-are illnesses brought on by the slow accumulation of damage, such as heart disease and cancer. When we worry or experience stress, our body turns on the same

physiological responses that an animal's does, but we do not resolve conflict in the same way-through fighting or fleeing. Over time, this activation of a stress response makes us literally sick. Combining cutting-edge research with a healthy dose of good humor and practical advice, *Why Zebras Don't Get Ulcers* explains how prolonged stress causes or intensifies a range of physical and mental afflictions, including depression, ulcers, colitis, heart disease, and more. It also provides essential guidance to controlling our stress responses. This new edition promises to be the most comprehensive and engaging one yet.
